I. Introduction

BOATS boats. Boats boats. I wish you the best of success.

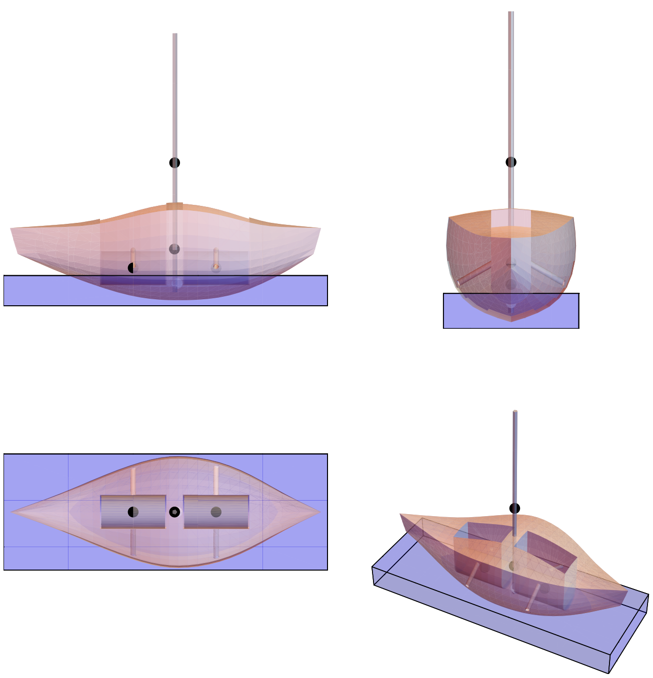

Fig. 1. Various views of the final boat design

A. Design Considerations

1) The boat floats.
2) The boat floats flat.
3) The boat has an angle of vanishing stability (AVS) of $120°$ to $140°$.
4) The boat accelerates quickly.
5) The boat is fast.
6) The boat is nice and sweet and sexy, alright.

In our design process, we identified the first three goals to be mainly computational, and the last two to be mostly qualitative.

1) The Boat Floats: In order for a boat to float above water its mass must be equal to the mass of water it displaces. If the total mass of the boat over the total volume of the boat is less than

Assume the volume of a boat is determined by the generalized format, given some region D that defines the boat.

$$V_{boat} = \iiint\limits_{D} dV \tag{1}$$

what

$$M = \iiint\limits_{D} \rho \, dV \tag{2}$$

$$C_{mass} = \frac{\iiint\limits_{D} (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) \rho_{boat} \, dV}{\iiint\limits_{D} \rho \, dV} \tag{3}$$

$$C_{buoyancy} = \frac{\iiint\limits_{D} (\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}) \rho_{water} \, dV}{\iiint\limits_{D} \rho \, dV} \tag{4}$$

II. Conclusion

The conclusion goes here.
